

# CUCKOO SANDBOX 安裝教學

CS4003701

資訊安全導論

# CUCKOO SANDBOX 安裝教學

- 1. 下載VMWARE
- 2. 創立UBUNTU虛擬機
- 3. 安裝CUCKOO SANDBOX
- 4. 安裝CUCKOO所需WIN7虛擬機
- 5. 初始化設定CUCKOO SANDBOX
- 6. 啟用CUCKOO SANDBOX
- 7. 備份與重啟CUCKOO SANDBOX
- 8. 使用CUCKOO SANDBOX
- 9. 繪製CALL API SEQUENCE
- 10. 撰寫CUCKOO SANDBOX腳本(參考用)
- 11. 虛擬機硬碟空間擴充(參考用)
- 12. PYCHARM+ANACONDA安裝教學(參考用)

# 下載VMWARE

<https://www.vmware.com/products/workstation-player/workstation-player-evaluation.html>

## VMware Workstation 17 Player

### VMware Workstation Player

VMware Workstation Player is an ideal utility for running a single virtual machine on a Windows or Linux PC. Organizations use Workstation Player to deliver managed corporate desktops, while students and educators use it for learning and training.

The free version is available for non-commercial, personal and home use. We also encourage students and non-profit organizations to benefit from this offering.

Commercial organizations require commercial licenses to use Workstation Player.

Need a more advanced virtualization solution? Check out [Workstation Pro](#).

Try Workstation 17 Player for Windows

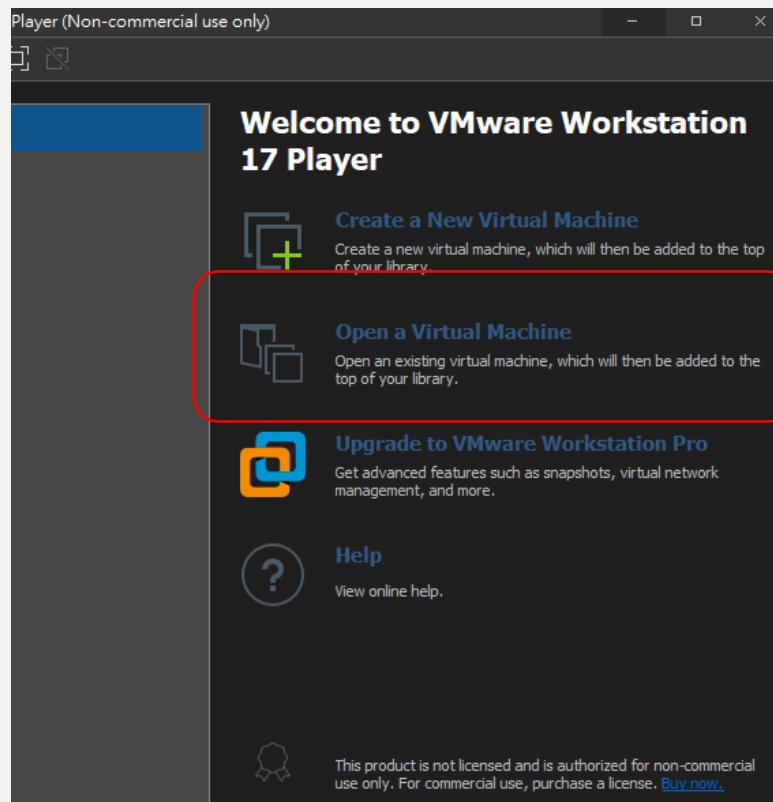

[DOWNLOAD NOW >](#)

Try Workstation 17 Player for Linux

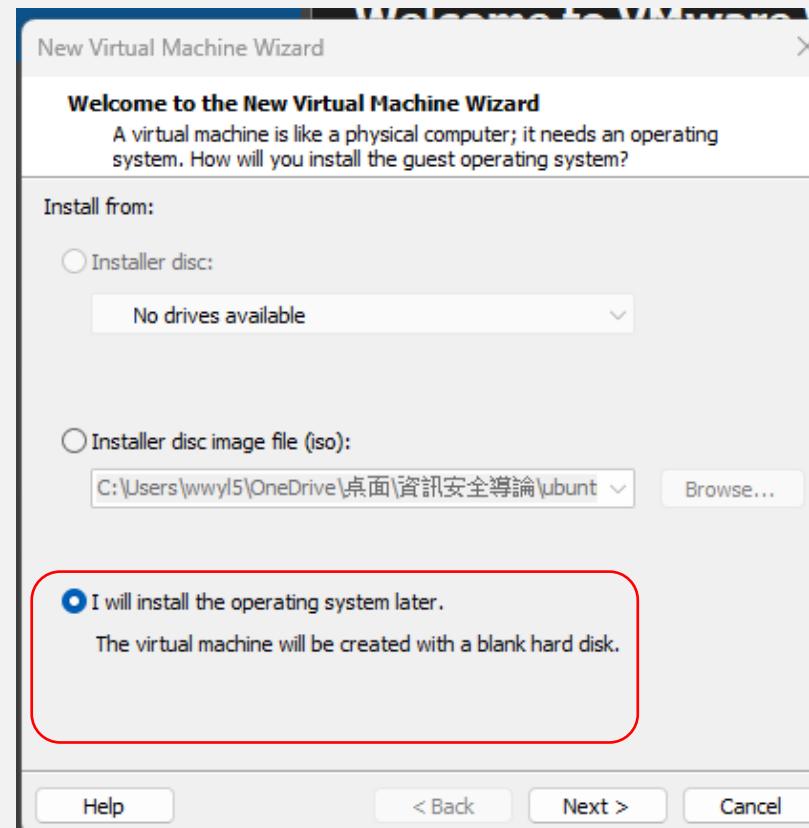

[DOWNLOAD NOW >](#)

# 創立UBUNTU虛擬機

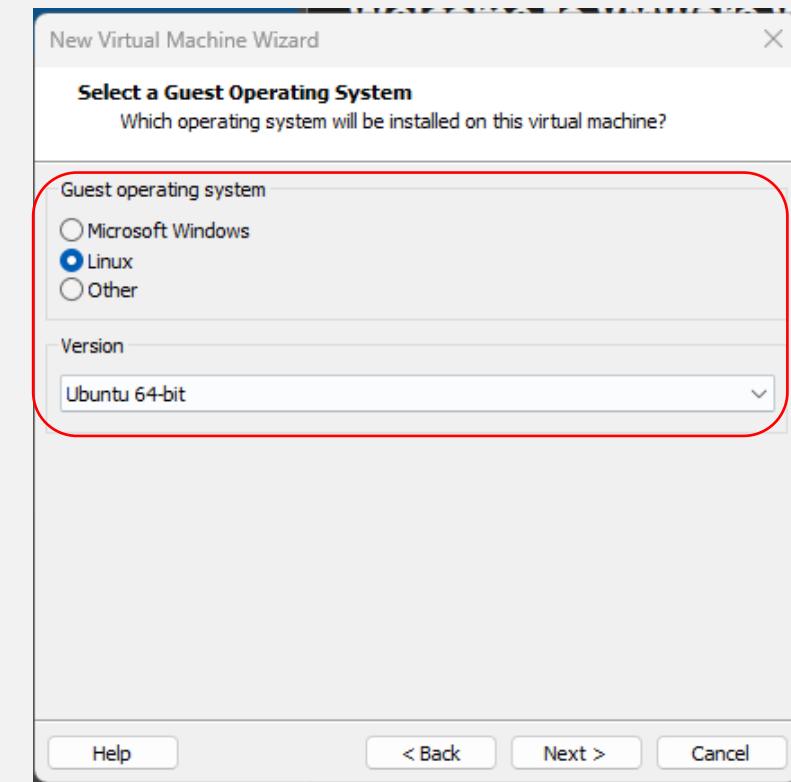

1.點選創建虛擬機

2.點選等等設定映像檔

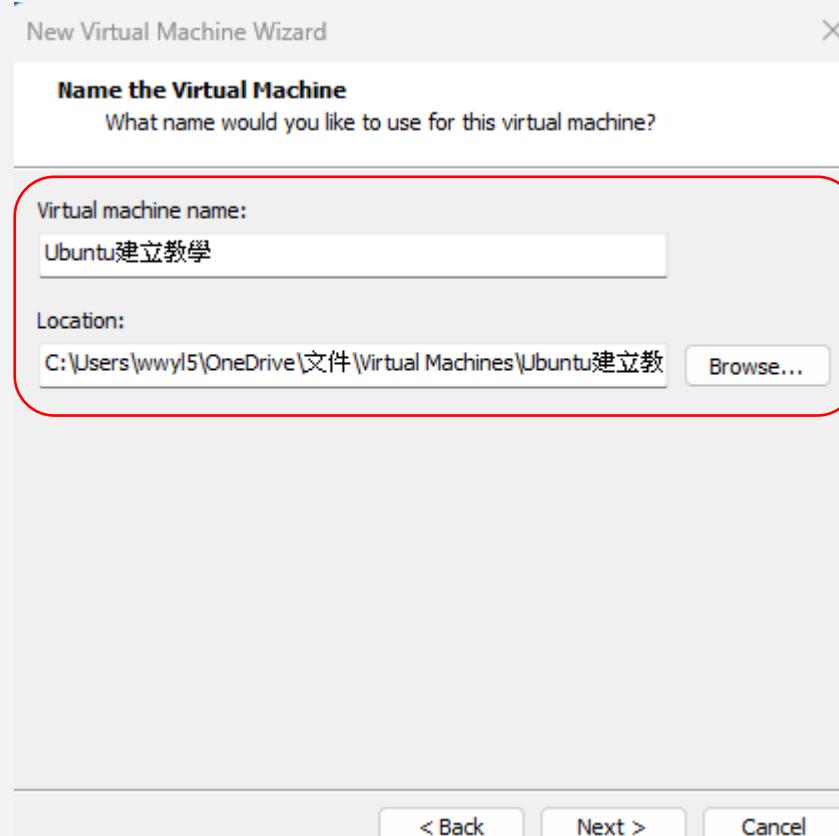

3.選擇Linux+Ubuntu64bit

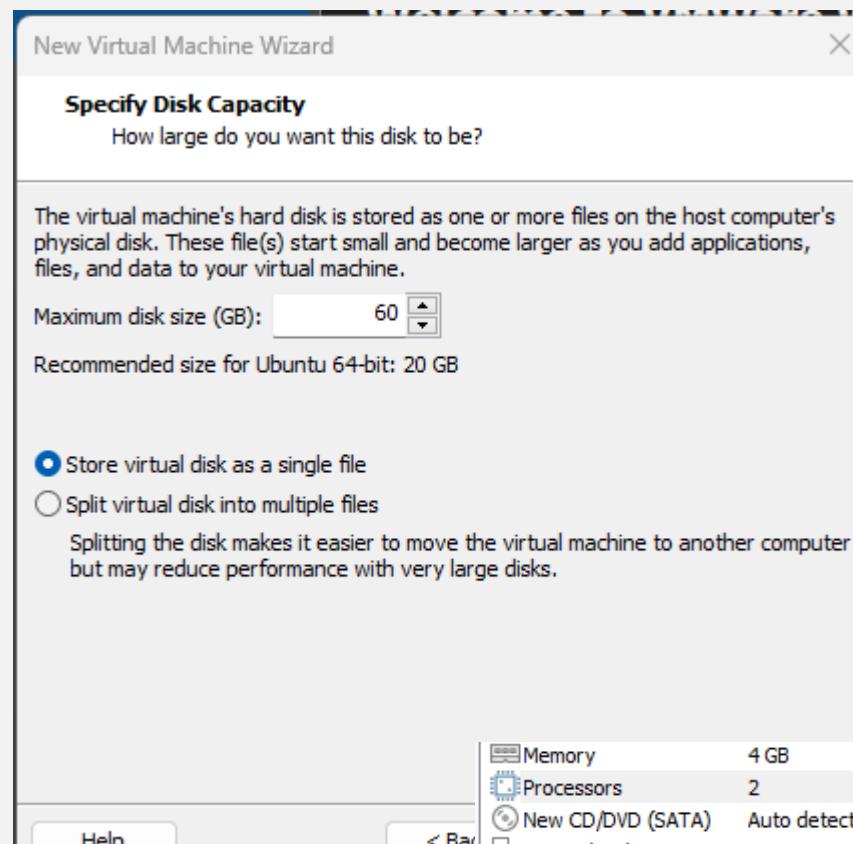

# 創立UBUNTU虛擬機

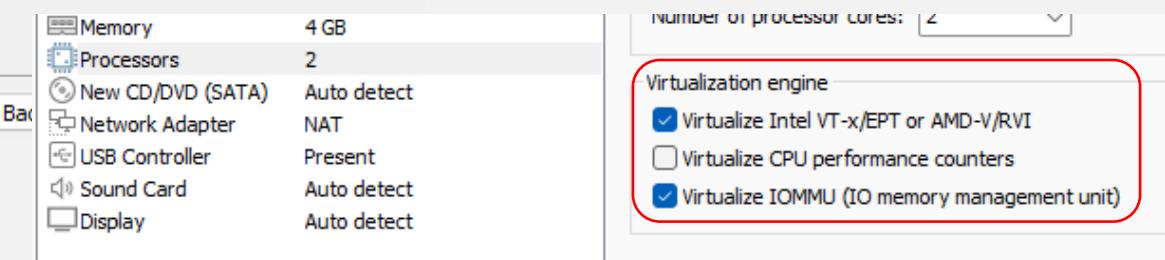

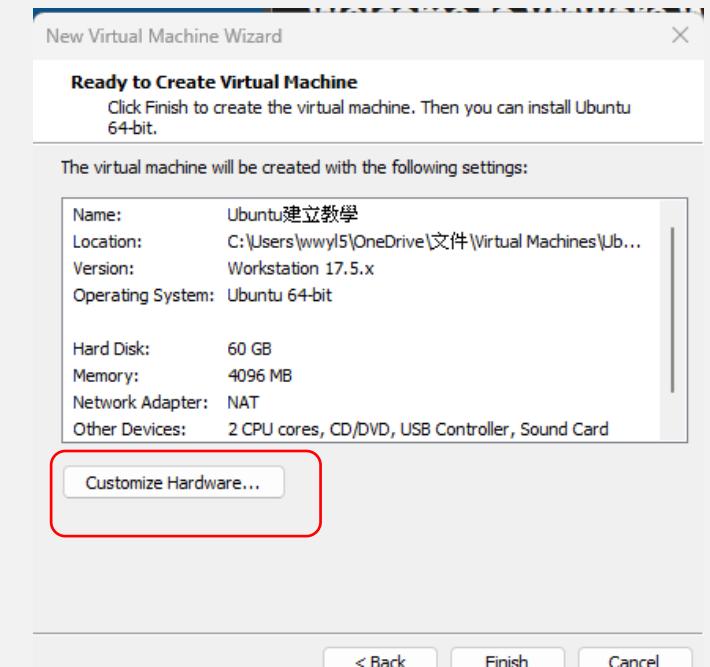

## 4. 選擇儲存位置 (要稍微記一下之後會用到)

## 5. 設定虛擬機硬碟大小，並設置儲存成一個檔案 (建議要>70GB，不過以後還可以擴充)

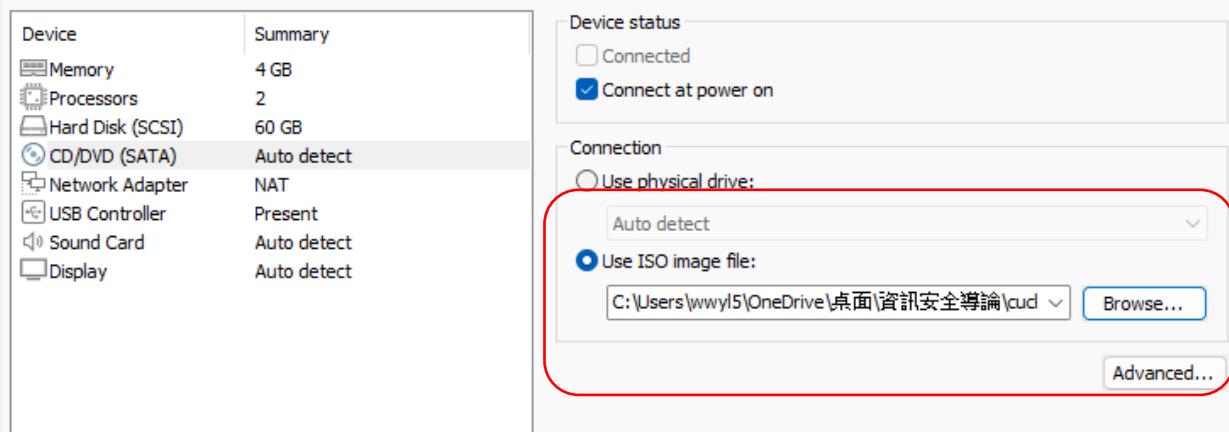

## 6. 處理器可視化設定

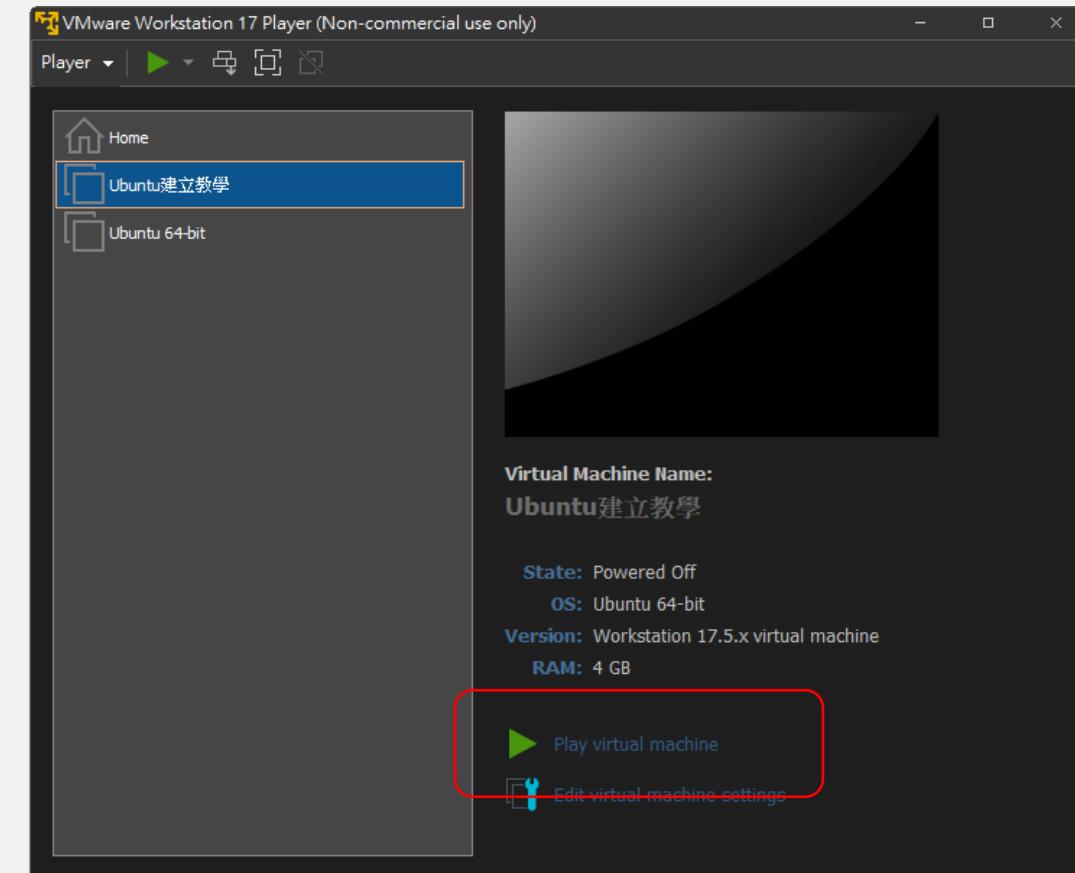

# 創立UBUNTU虛擬機

## 7. 設定映像檔路徑(於MOODLE上下載) (UBUNTU-18.04.ISO)

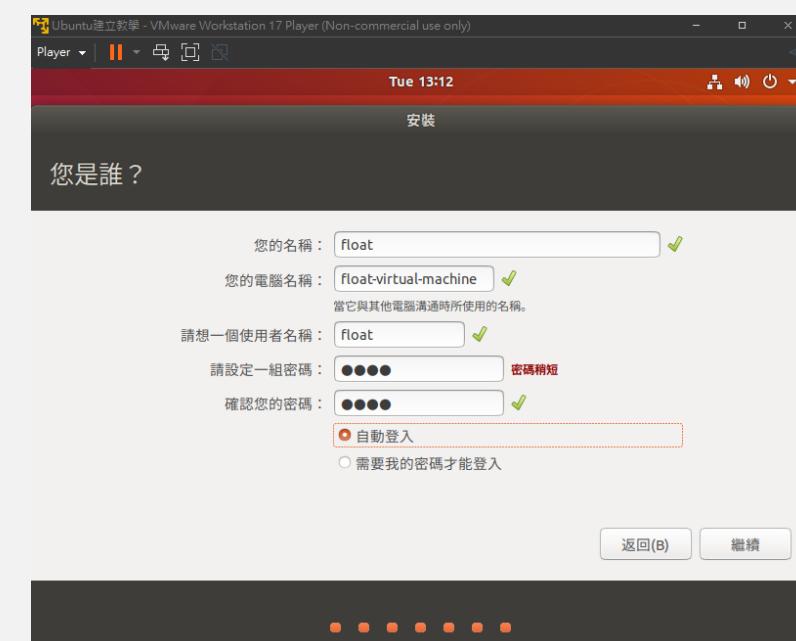

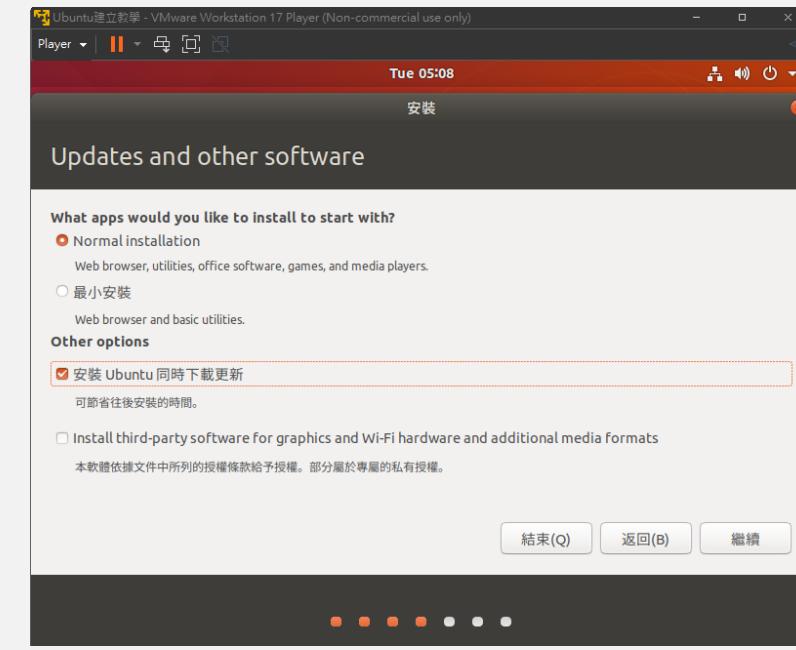

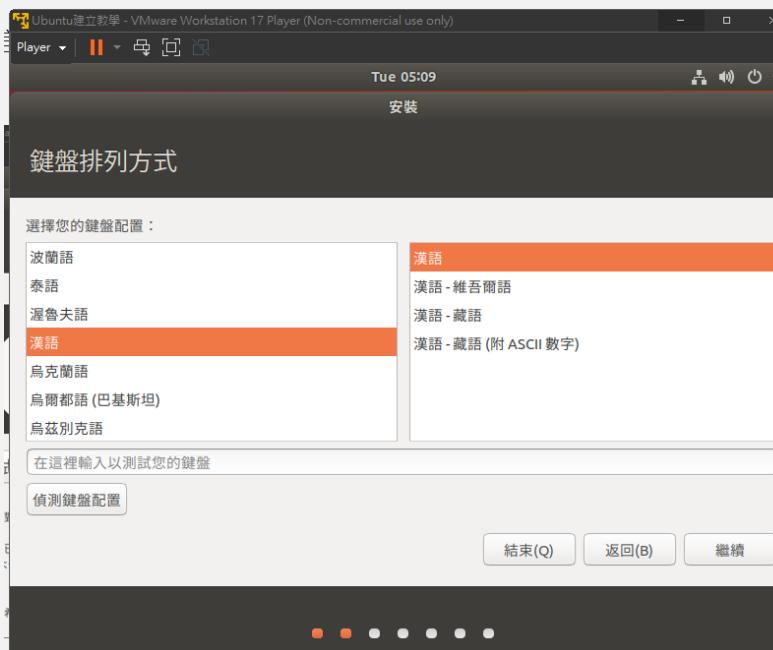

## 8. 開啟虛擬機進行作業系統安裝

# 創立UBUNTU虛擬機

## 9. 點擊安裝程序

# 創立UBUNTU虛擬機

10. 調整螢幕大小，可以先將”設定”視窗調小再設定(記得別升級到UBUNTU20.04)

# 安裝CUCKOO SANDBOX

## 1.更新套件庫:

- sudo apt-get update

## 2.下載相關套件:

- sudo apt-get -y install python python-pip python-dev libffi-dev libssl-dev
- sudo apt-get -y install python-virtualenv python-setuptools
- sudo apt-get -y install libjpeg-dev zlib1g-dev swig

## 3.下載MongoDB:

- sudo apt-get -y install mongodb

## 4.下載PostgreSQL:

- sudo apt-get -y install postgresql libpq-dev

## 5.下載VirtualBox:

- sudo apt-get -y install virtualbox

## 6.下載tcpdump AppArmor:

- sudo apt-get -y install tcpdump apparmor-utils

```
Success. You can now start the database server using:  
/usr/lib/postgresql/10/bin/pg_ctl -D /var/lib/postgresql/10/main -l logfile  
start  
Ver Cluster Port Status Owner      Data directory      Log file  
10  main      5432 down    postgres /var/lib/postgresql/10/main /var/log/postgresql  
/postgresql-10-main.log  
update-alternatives: using /usr/share/postgresql/10/man/man1/postmaster.1.gz to  
provide /usr/share/man/man1/postmaster.1.gz (postmaster.1.gz) in auto mode  
設定 postgresql (10+190ubuntu0.1) ...  
Processing triggers for man-db (2.8.3-2ubuntu0.1) ...  
Processing triggers for ureadahead (0.100.0-21) ...  
Processing triggers for libc-bin (2.27-3ubuntu1.4) ...  
Processing triggers for systemd (237-3ubuntu10.52) ...  
float@float-virtual-machine:~$
```

# 安裝CUCKOO SANDBOX

## 8.設定tcpdump AppArmor解除限制:

- sudo aa-disable /usr/sbin/tcpdump

```
float@float-virtual-machine:~$ sudo aa-disable /usr/sbin/tcpdump
Disabling /usr/sbin/tcpdump.
float@float-virtual-machine:~$
```

## 9.讓tcpdump獲得後台運行權限:

- sudo setcap cap\_net\_raw,cap\_net\_admin=eip /usr/sbin/tcpdump

## 10.驗證設定是否成功:

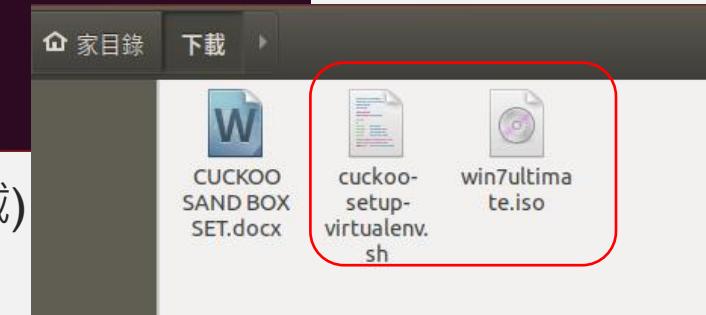

- getcap /usr/sbin/tcpdump

```
float@float-virtual-machine:~$ sudo setcap cap_net_raw,cap_net_admin=eip /usr/sbin/tcpdump
float@float-virtual-machine:~$ getcap /usr/sbin/tcpdump
/usr/sbin/tcpdump = cap_net_admin,cap_net_raw+eip
float@float-virtual-machine:~$
```

## 11.下載M2Crypto:

- pip install 'm2crypto<0.36'

```
Stored in directory: /home/float/.cache/pip/wheels/6d/b3/6e/4c057fb6aafc93b1a8
d5607d46da439260ae21dbc3e9ceba8
Successfully built m2crypto
Installing collected packages: typing, m2crypto
Successfully installed m2crypto-0.35.2 typing-3.10.0.0
float@float-virtual-machine:~$
```

## 12.將cuckoo-setup-virtualenv.sh+win7ultimate.iso檔下載到虛擬機(從Moodle上下載)

## 13.進入cuckoo-setup-virtualenv.sh所在資料夾，賦予執行腳本權限:

- sudo chmod +x cuckoo-setup-virtualenv.sh

```
float@float-virtual-machine:~$ cd 下載
float@float-virtual-machine:~/下載$ sudo chmod +x cuckoo-setup-virtualenv.sh
float@float-virtual-machine:~/下載$
```

## 14.安裝沙盒環境套件:

- sudo -u username ./cuckoo-setup-virtualenv.sh

```
float@float-virtual-machine:~/下載$ sudo -u float ./cuckoo-setup-virtualenv.sh
已有:1 https://dl.google.com/linux/chrome/deb stable InRelease
已有:2 http://tw.archive.ubuntu.com/ubuntu bionic InRelease
已有:3 http://tw.archive.ubuntu.com/ubuntu bionic-updates InRelease
已有:4 http://tw.archive.ubuntu.com/ubuntu bionic-backports InRelease
已有:5 http://security.ubuntu.com/ubuntu bionic-security InRelease
```

# 安裝CUCKOO SANDBOX

15.再次確認沙盒套件已下載成功:

- sudo apt-get update && sudo apt-get -y install virtualenv
- sudo apt-get -y install virtualenvwrapper
- sudo apt-get -y install python3-pip

16.再次確認環境變數是否生效:

- source ~/.bashrc

17.創建沙盒:

- mkvirtualenv -p python2.7 sandbox

18.安裝Cuckoo Sandbox:(記得要確定你在剛創的沙盒裡面安裝)

- pip install -U pip setuptools
- pip install -U cuckoo

19.掛載win7映像檔到虛擬機裡:(在沙盒外面進行)

- sudo mkdir /mnt/win7
- sudo chown username:username /mnt/win7
- sudo mount -o ro,loop win7ultimate.iso /mnt/win7

```
(sandbox) float@float-virtual-machine:~/下載$ pip install -U pip setuptools
DEPRECATION: Python 2.7 reached the end of its life on January 1st, 2020. Please
upgrade your Python as Python 2.7 is no longer maintained. pip 21.0 will drop s
upport for Python 2.7 in January 2021. More details about Python 2 support in pi
p can be found at https://pip.pypa.io/en/latest/development/release-process/#pyt
hon-2-support pip 21.0 will remove support for this functionality.
Requirement already up-to-date: pip in /home/float/.virtualenvs/sandbox/lib/pyth
on2.7/site-packages (20.3.4)
Requirement already up-to-date: setuptools in /home/float/.virtualenvs/sandbox/l
ib/python2.7/site-packages (44.1.1)
```

```
float@float-virtual-machine:~$ sudo mkdir /mnt/win7
[sudo] password for float:
float@float-virtual-machine:~$ sudo chown float:float /mnt/win7
float@float-virtual-machine:~$ 
```

```
float@float-virtual-machine:~/下載$ sudo mount -o ro,loop win7ultimate.iso /mnt/
win7
float@float-virtual-machine:~/下載$ 
```

# 安裝CUCKOO所需WIN7虛擬機

## 20.再次確認相關套件是否安裝成功:(在沙盒外面確認)

- sudo apt-get -y install build-essential libssl-dev libffi-dev python-dev genisoimage
- sudo apt-get -y install zlib1g-dev libjpeg-dev
- sudo apt-get -y install python-pip python-virtualenv python-setuptools swig

## 21.下載vmcloak虛擬機:(在沙盒裡面下載)

- pip install -U vmcloak
- vmcloak

## 22.用vmclock設定HOST-ONLY network:

- vmcloak-vboxnet0

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak  
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt  
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the  
Python core team. Support for it is now deprecated in cryptography, and will be  
removed in the next release.  
    from cryptography import utils, x509  
(sandbox) float@float-virtual-machine:~/下載$
```

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak-vboxnet0  
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%  
Interface 'vboxnet0' was successfully created  
(sandbox) float@float-virtual-machine:~/下載$
```

## 23.開始在沙盒中安裝win7虛擬機:

- vmcloak init --verbose --win7x64 win7x64base --cpus 2 --ramsize 2048

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak init --verbose --win7x64 w  
in7x64base --cpus 2 --ramsize 2048  
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt  
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the  
Python core team. Support for it is now deprecated in cryptography, and will be  
removed in the next release.  
    from cryptography import utils, x509  
INFO:vmcloak.abstract:Got file 'python-2.7.6.msi' from 'https://www.python.org/f  
tp/python/2.7.6/python-2.7.6.msi', with matching checksum.  
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%  
INFO:vmcloak:Starting the Virtual Machine u'win7x64base' to install Windows.
```

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak init --verbose --win7x64 w  
in7x64base --cpus 2 --ramsize 2048  
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt  
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the  
Python core team. Support for it is now deprecated in cryptography, and will be  
removed in the next release.  
    from cryptography import utils, x509  
INFO:vmcloak.abstract:Got file 'python-2.7.6.msi' from 'https://www.python.org/f  
tp/python/2.7.6/python-2.7.6.msi', with matching checksum.

INFO:vmcloak:Starting the Virtual Machine u'win7x64base' to install Windows.  
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%  
INFO:vmcloak:Added image u'win7x64base' to the repository.  
(sandbox) float@float-virtual-machine:~/下載$
```

# 安裝CUCKOO所需WIN7虛擬機

24.去開啟Virtualbox點擊”顯示”進行windows安裝程序:

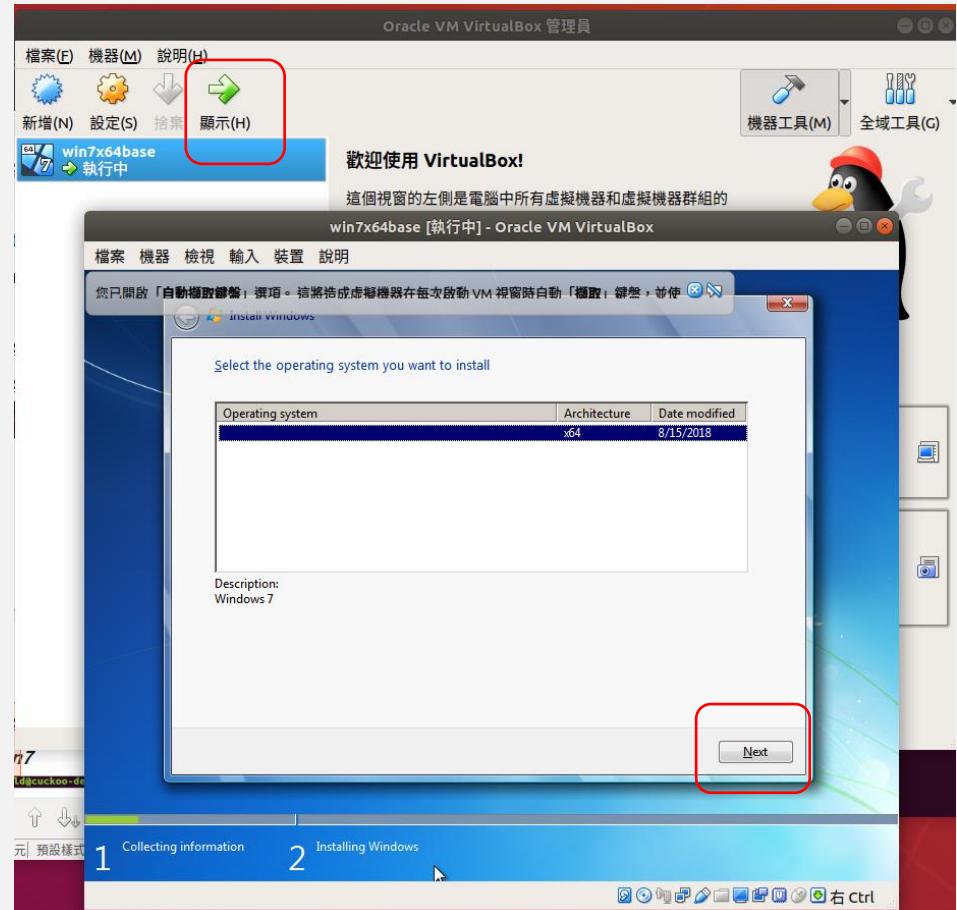

25.複製剛剛安裝的windows虛擬機:

- `vmcloak clone win7x64base win7x64cuckoo`

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak clone win7x64base win7x64cuckoo
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the
Python core team. Support for it is now deprecated in cryptography, and will be
removed in the next release.
    from cryptography import utils, x509
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
```

26.創建4個相同的windows虛擬機:(提供cuckoo sandbox多工執行)

- `vmcloak snapshot --count 4 win7x64cuckoo 192.168.56.101`

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak snapshot --count 4 win7x64cuckoo 192.168.56.101
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the
Python core team. Support for it is now deprecated in cryptography, and will be
removed in the next release.
    from cryptography import utils, x509
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
0%...10%...20%...30%...40%...50%...60%...70%...80%...90%...100%
(sandbox) float@float-virtual-machine:~/下載$
```

# 安裝CUCKOO所需WIN7虛擬機

27.列出目前安裝好的windows虛擬機:

- vmcloak list vms

```
(sandbox) float@float-virtual-machine:~/下載$ vmcloak list vms
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypt
o.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the
Python core team. Support for it is now deprecated in cryptography, and will be
removed in the next release.
  from cryptography import utils, x509
192.168.56.1011 192.168.56.101
192.168.56.1012 192.168.56.102
192.168.56.1013 192.168.56.103
192.168.56.1014 192.168.56.104
(sandbox) float@float-virtual-machine:~/下載$
```

28.初始化並進入cuckoo的config dictionary:

- cuckoo init
- cd .cuckoo/conf
- cuckoo community --force

```
(sandbox) float@float-virtual-machine:~$ cd .cuckoo/conf
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ cuckoo community --force
2024-03-05 15:21:22,911 [cuckoo.apps.apps] INFO: Downloading.. https://github.co
m/cuckoosandbox/community/archive/master.tar.gz
2024-03-05 15:21:27,865 [cuckoo] INFO: Finished fetching & extracting the commun
ity files!
(sandbox) float@float-virtual-machine:~/cuckoo/conf$
```

```
(sandbox) float@float-virtual-machine:~/下載$ cuckoo init
      eeee e   e eeee e   e   eeeeeeeeee
      8   8 8   8 8   8 8   8 88 8   88
      8e   8e 8 8e   8eee8e 8   8 8   8
      88   8 88   88   8 8   8 8   8
      88e8 88ee8 88e8 88   8 8eee8 8eee8

Cuckoo Sandbox 2.0.7
www.cuckoosandbox.org
Copyright (c) 2010-2018

=====
Welcome to Cuckoo Sandbox, this appears to be your first run!
We will now set you up with our default configuration.
You will be able to see and modify the Cuckoo configuration,
Yara rules, Cuckoo Signatures, and much more to your likings
by exploring the /home/float/.cuckoo directory.

Among other configurable items of most interest is the
new location for your Cuckoo configuration:
/home/float/.cuckoo/conf

=====
Cuckoo has finished setting up the default configuration.
Please modify the default settings where required and
start Cuckoo again (by running `cuckoo` or `cuckoo -d`).
(sandbox) float@float-virtual-machine:~/下載$
```

# 初始化設定 CUCKOO SANDBOX

29. 開啟.cuckoo/conf/virtualbox.conf並把mode的headless改成gui:

- nano virtualbox.conf
- mode = gui
- ^x+y+enter(儲存)

30. 把變更應用在其他3個虛擬機身上:

- while read -r vm ip; do cuckoo machine --add \$vm \$ip; done <<(vmcloak list vms)

```
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ while read -r vm ip; do cuckoo machine --add $vm $ip; done <<(vmcloak list vms)
/home/float/.virtualenvs/sandbox/local/lib/python2.7/site-packages/OpenSSL/crypto.py:14: CryptographyDeprecationWarning: Python 2 is no longer supported by the Python core team. Support for it is now deprecated in cryptography, and will be removed in the next release.
    from cryptography import utils, x509
(sandbox) float@float-virtual-machine:~/cuckoo/conf$
```

31. 再打開virtualbox.conf，把machines的cuckoo1刪掉，然後把controlports=5000-5050的下面都刪除直到[192.168.56.1011]:  
(記得儲存^x+y+enter)

```
# Specify a comma-separated list of available machines to be used. For each
# specified ID you have to define a dedicated section containing the details
# on the respective machine. (E.g. cuckoo1,cuckoo2,cuckoo3)
machines = cuckoo1, 192.168.56.1011, 192.168.56.1012, 192.168.56.1013, 192.168.56.1014
```

```
[virtualbox]
# Specify which VirtualBox
# Can be "gui" or "headless"
# documentation to understand
mode = gui
```

```
# If remote control is enabled
# Virtualbox will bind the VRAM
controlports = 5000-5050
[192.168.56.1011]
# Specify the label name of the
# VirtualBox configuration.
```

# 初始化設定 CUCKOO SANDBOX

## 32. 檢查設定:

- ip a

```
(sandbox) jonald@cuckoo-deno:~/cuckoo/conf$ ip a
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue
    link/loopback brd 00:00:00:00:00:00
    inet 127.0.0.1/8 brd 00:00:00:00:00:00
        valid_lft forever preferred_lft forever
    inet6 ::1/128 brd 00:00:00:00:00:00
        valid_lft forever preferred_lft forever
2: ens33: <NO-CARRIER,BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500
    link/ether 00:0c:29:04:c6:a3 brd ff:ff:ff:ff:ff:ff
    inet 192.168.189.138/24 brd 192.168.189.255 scope
        valid_lft 00:00:00 preferred_lft 00:00:00
```

## 33. 設定參數:(在沙盒裡設置)

- sudo sysctl -w net.ipv4.conf.vboxnet0.forwarding=1
- sudo sysctl -w net.ipv4.conf.ens33.forwarding=1
- sudo iptables -t nat -A POSTROUTING -o ens33 -s 192.168.56.0/24 -j MASQUERADE
- sudo iptables -P FORWARD DROP
- sudo iptables -A FORWARD -m state --state RELATED,ESTABLISHED -j ACCEPT
- sudo iptables -A FORWARD -s 192.168.56.0/24 -j ACCEPT

```
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo sysctl -w net.ipv4.conf.vboxnet0.forwarding=1
[sudo] password for float:
net.ipv4.conf.vboxnet0.forwarding = 1
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo sysctl -w net.ipv4.conf.ens33.forwarding=1
net.ipv4.conf.ens33.forwarding = 1
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo iptables -t nat -A POSTROUTING -o ens33 -s 192.168.56.0/24 -j MASQUERADE
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo iptables -P FORWARD DROP
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo iptables -A FORWARD -m state --state RELATED,ESTABLISHED -j ACCEPT
(sandbox) float@float-virtual-machine:~/cuckoo/conf$ sudo iptables -A FORWARD -s 192.168.56.0/24 -j ACCEPT
(sandbox) float@float-virtual-machine:~/cuckoo/conf$
```

## 啟用 CUCKOO SANDBOX(I)

### 34. 下載 terminator:(在沙盒外面)

- sudo apt-get install terminator

```
float@float-virtual-machine:~/下載$ sudo apt-get install terminator
正在讀取套件清單... 完成
正在重建相依關係
正在讀取狀態資料... 完成
下列的額外套件將被安裝：
```

### 35. 開一個新終端，我們叫它TI，進入沙盒:

- workon sandbox

### 36. 以root執行cuckoo，讓TI運行不要動它:

- cuckoo rooter --sudo --group username

```
float@float-virtual-machine:~$ workon sandbox
(sandbox) float@float-virtual-machine:~$ cuckoo rooter --sudo --group float
[sudo] password for float:
2024-03-05 15:33:22,123 [cuckoo] INFO: Starting Cuckoo Rooter (group=float)!
```

## 初始化設定 CUCKOO SANDBOX

37.回到剛剛那個終端，開啟routing.conf，把Internet後面的none改成ens33:

- nano routing.conf
- ^x+y+enter(儲存)

```
# Network interface that allows a VM to connect to the entire internet, the
# "dirty line" so to say. Note that, just like with the VPNs, this will allow
# malicious traffic through your network. So think twice before enabling it.
# (For example, to use eth0 as dirty line: "internet = eth0").
internet = ens33
```

38.開啟reporting.conf，把mongodb欄位的enabled的no改成yes:(記得儲存)

```
[mongodb]
enabled = yes
host = 127.0.0.1
port = 27017
db = cuckoo
store_memdump = yes
paginate = 100
# MongoDB authentication (optional).
```

# 啟用 CUCKOO SANDBOX(2)

39.再開一個新的終端，我們叫它T2，進入沙盒，執行cuckoo，他會持續運行，放著不要動：

- workon sandbox
  - cuckoo

```
(sandbox) float@float-virtual-machine:~$ cuckoo

```

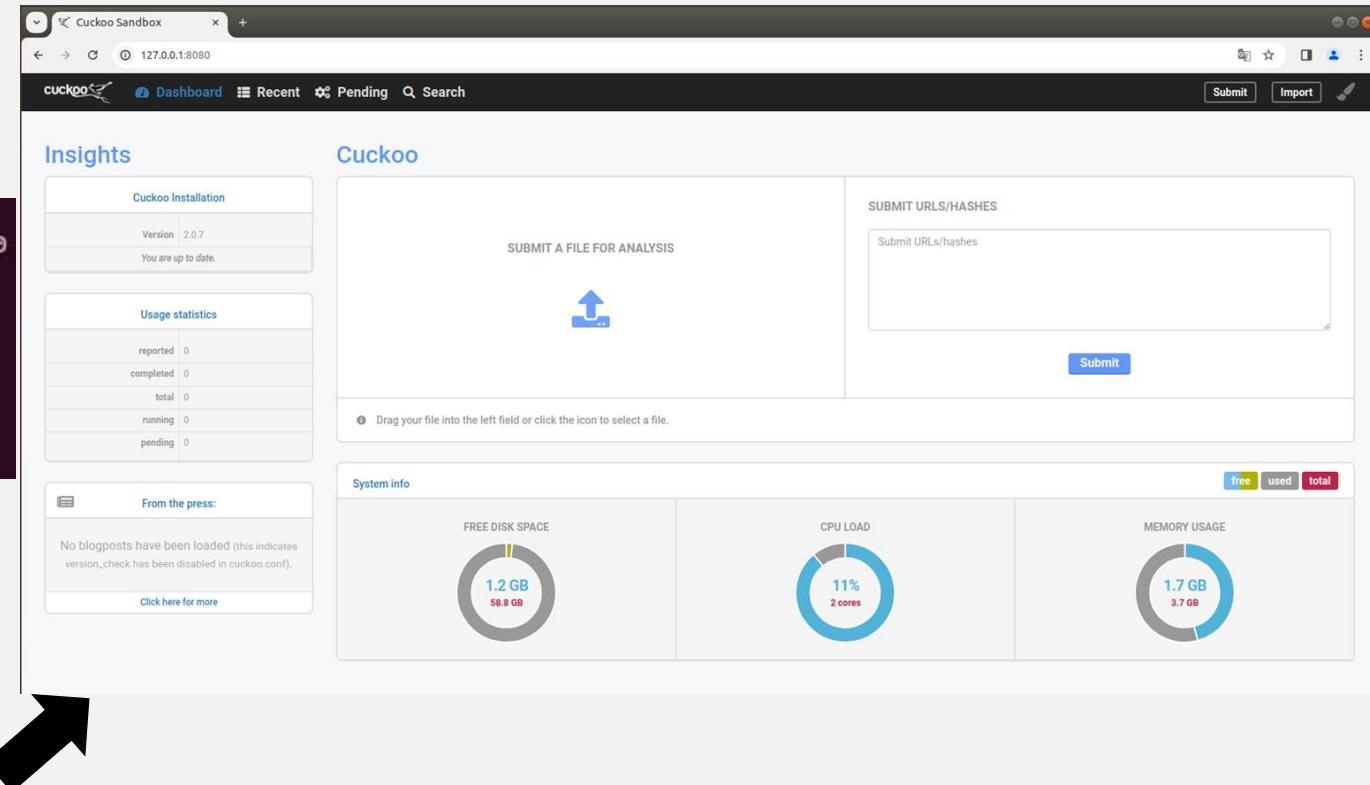

## 啟用CUCKOO SANDBOX(3)

40. 開第三個新終端T3，進入沙盒，連線到網頁gui server，讓它持續運行：

- workon sandbox
- cuckoo web --host 127.0.0.1 --port 8080

```
float@float-virtual-machine:~$ workon sandbox
(sandbox) float@float-virtual-machine:~$ cuckoo web --host 127.0.0.1 --port 8080
Performing system checks...

System check identified no issues (0 silenced).
March 05, 2024 - 15:45:01
Django version 1.8.4, using settings 'cuckoo.web.web.settings'
Starting development server at http://127.0.0.1:8080/
Quit the server with CONTROL-C.
```

41. 開啟網站，這就是cuckoo的gui介面，記得T1、T2、T3都要放著讓它運行，不然CUCKOO會停止運作：

- <http://127.0.0.1:8080>

## 備份與重啟 CUCKOO SANDBOX

- 當你成功開啟T1,T2,T3之後，請注意，盡量以暫停虛擬機的方式取代關閉虛擬機，因為一關機的話設定就會跑掉，需要重新設置，否則cuckoo sandbox會無法使用，下面是兩種備份重啟的方法。

(I) 虛擬機備份:缺點是整個vm的狀態會回復到備份之前，所有檔案與程式都要重新下載。

I. 接下來先把虛擬機暫停，這樣他就會停止在運行的狀態，下次開啟還會繼續運行，不用重開:

2. 找到當初存虛擬機的檔案位置，把整個虛擬機資料夾備份，若之後發現壞檔，則覆蓋掉壞掉的檔案，進行回檔:

(2) 重啟 Cuckoo sandbox:

- 若遇到vm當機，或是需要擴充硬碟空間等不得不關機的狀況時，使用下列步驟重新設定:

I. 用vmclock設定HOST-ONLY network:

- workon sandbox
- vmcloak-vboxnet0

# 備份與重啟 CUCKOO SANDBOX

## 2. 重新設定參數:(在沙盒裡設置)

- sudo sysctl -w net.ipv4.conf.vboxnet0.forwarding=1
  - sudo sysctl -w net.ipv4.conf.ens33.forwarding=1
  - sudo iptables -t nat -A POSTROUTING -o ens33 -s 192.168.56.0/24 -j MASQUERADE
  - sudo iptables -P FORWARD DROP
  - sudo iptables -A FORWARD -m state --state RELATED,ESTABLISHED -j ACCEPT
  - sudo iptables -A FORWARD -s 192.168.56.0/24 -j ACCEPT

### 3.重新開啟T1 T2 T3:

T1:

- workon sandbox
  - cuckoo rooter --sudo --group username

T2:

- workon sandbox
  - Cuckoo

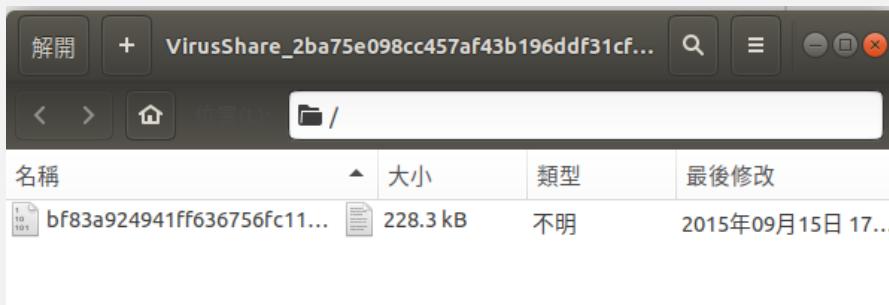

T3:

- workon sandbox
  - cuckoo web --host 127.0.0.1 --port 8080

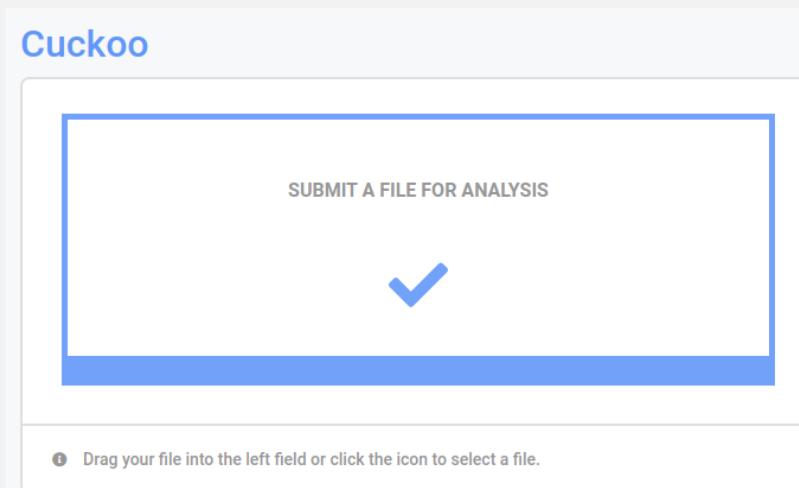

```
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo sysctl -w net.ipv4.conf.vboxnet0.forwarding=1
[sudo] password for float:
net.ipv4.conf.vboxnet0.forwarding = 1
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo sysctl -w net.ipv4.conf.ens33.forwarding=1
net.ipv4.conf.ens33.forwarding = 1
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo iptables -t nat -A POSTROUTING -o ens33 -s 192.168.56.0/24 -j MASQUERADE
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo iptables -P FORWARD DROP
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo iptables -A FORWARD -m state --state RELATED,ESTABLISHED -j ACCEPT
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$ sudo iptables -A FORWARD -s 192.168.56.0/24 -j ACCEPT
(sandbox) float@float-virtual-machine:~/.cuckoo/conf$
```

# 使用CUCKOO SANDBOX

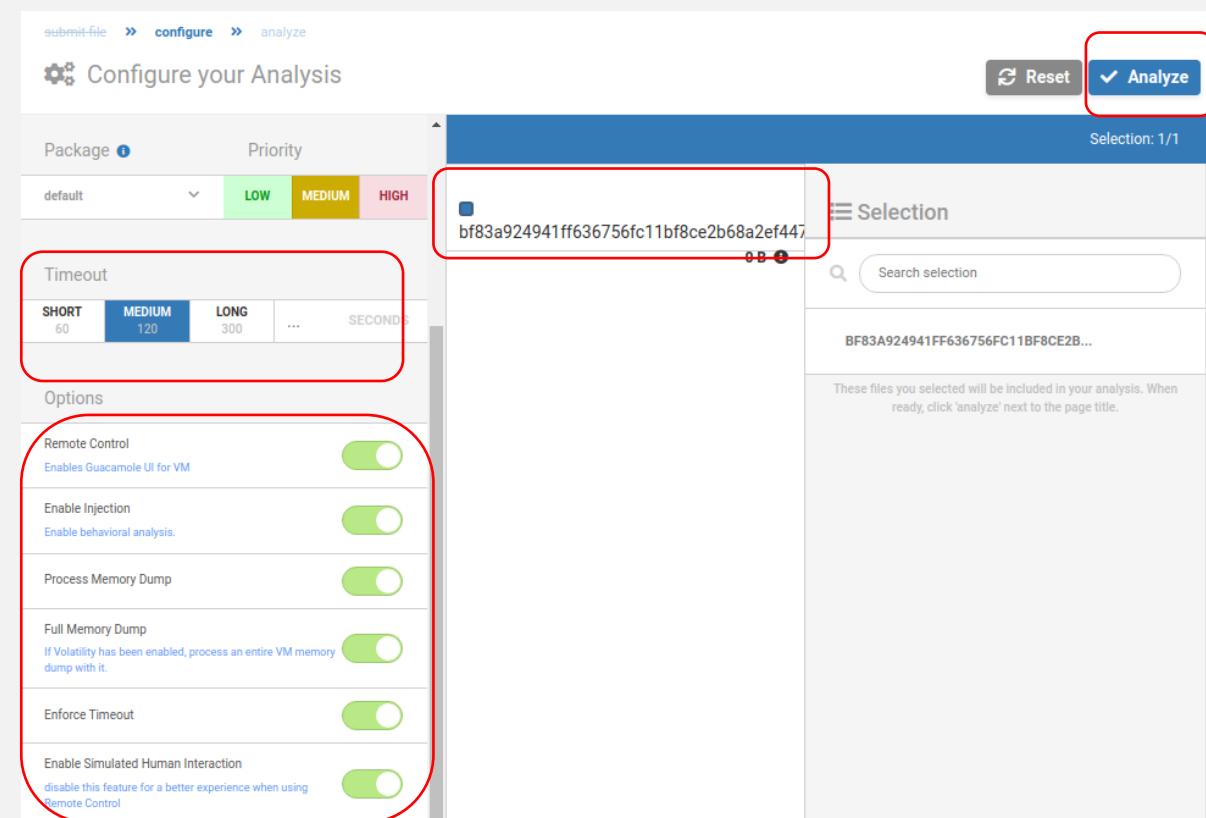

1. 將病毒檔解壓縮:

2. 丟入中間的提交區:

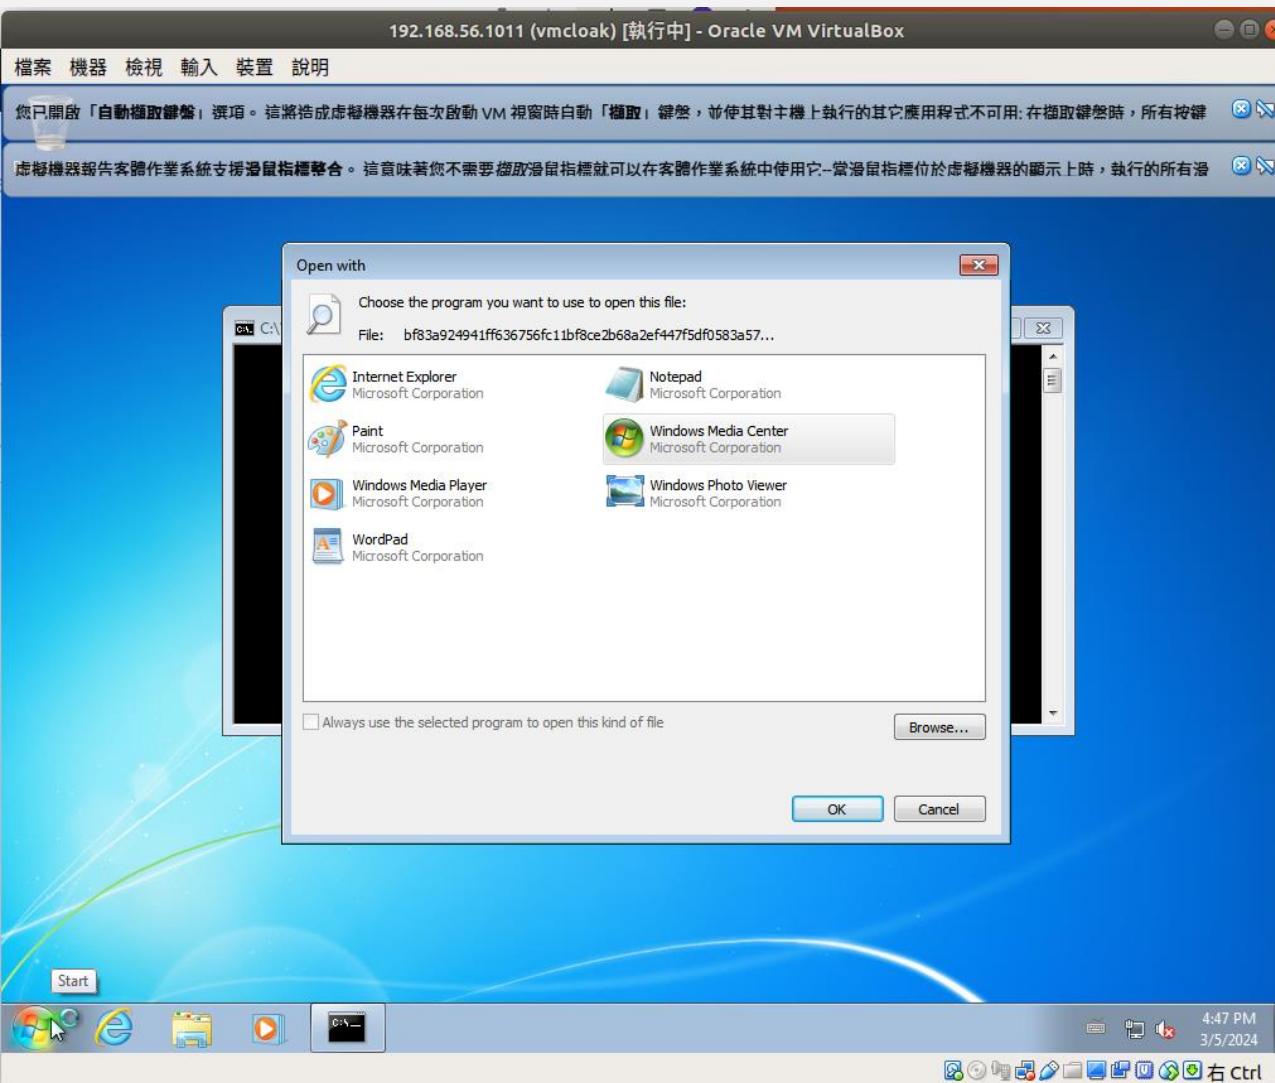

3. 設定執行時間等設定，勾選該病毒檔，開始分析:

# 使用 CUCKOO SANDBOX

4. 它會自動執行win7虛擬機進行分析:

5. 結束之後它會打勾:

Tasks: Refreshes every 2.5 seconds				
Task ID	Date	Filename / URL	Package	
1	05/03/2024 16:47	bf83a924941ff636756fc11bf8ce2b68a2ef447f5df0583a57c8899632954287	-	reported

6. 按recent，選擇你要下載的分析報告:

cuckoo				
Files	URLs	Score 0 - 4	Score 4 - 7	Score 7 - 10
1 2024-03-05 16:49 d41d8cd98f00b204e9800998ecf8427e				bf83a924941ff636756fc11bf8ce2b68a2ef447f5df0583a57c8899632954287 4287

# 使用CUCKOO SANDBOX

7.點擊輸出分析報告:

Summary

File bf83a924941ff636756fc11bf8

Size	
Type	empty

8.只要勾選reports並下載:

Export analysis

Options

Select which files you want to include in the export.

logs (4 files)	tlsmaster.txt
shots (0 files)	cuckoo.log
files (0 files)	memory.dmp
buffer (0 files)	dump.pcap
<input checked="" type="checkbox"/> reports (1 files)	analysis.log
network (2 files)	task.json
memory (2 files)	reboot.json
extracted (1 files)	binary
	files.json
	dump_sorted.pcap

Chosen analysis nr.1 to export  
bf83a924941ff636756fc11bf8ce2b68a2ef447f5df0583a5

Download 2.5 MB

9.會得到一個壓縮檔，點進去找report.json:

(其中的behavior裡面的processes裡的calls欄位就是我們要的結果)

```
[{"behavior": {  
    "generic": [  
        {"process_path": "C:\\Windows\\System32\\rundll32.exe",  
        "process_name": "rundll32.exe",  
        "pid": 2472,  
        "summary": {  
            "regkey_written": [
```

# 繪製CALL API SEQUENCE

# API call sequence 轉成影像

根據paper上的規則轉成影像

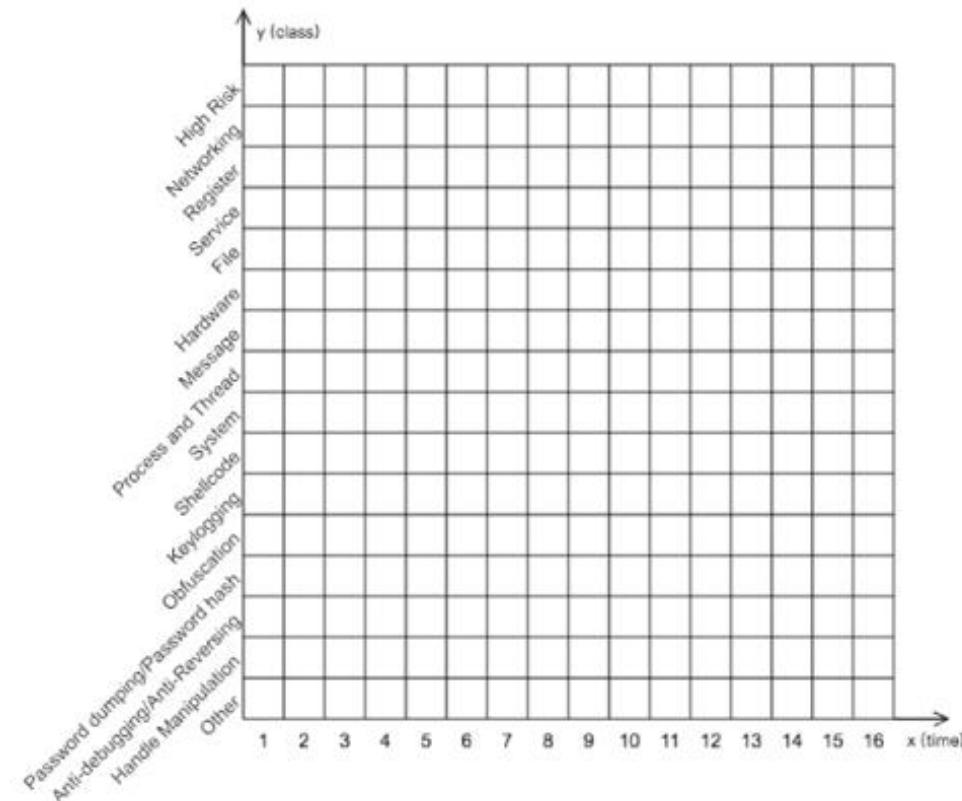

其中X軸為時間軸，切成16等分

Y軸為API call 的種類及功能，也是16等分

X軸的部分，取最早的API call當 start time

最晚的API call當 end time

Y軸的項目為自定義不一定要照著paper 的分類。

# 繪製CALL API SEQUENCE

# 撰寫 CUCKOO SANDBOX 腳本(參考用)

若希望批量製作分析檔，可以使用cuckoo提供的輕量化API server，以python撰寫腳本，將整個資料集逐個上傳分析。

參考網址:<https://cuckoo.readthedocs.io/en/latest/usage/api/>

## REST API

As mentioned in [Submit an Analysis](#), Cuckoo provides a simple and lightweight REST API server that is under the hood implemented using [Flask](#).

### Starting the API server

In order to start the API server you can simply do:

```
$ cuckoo api
```

By default it will bind the service on `localhost:8090`. If you want to change those values, you can use the following syntax:

```
$ cuckoo api --host 0.0.0.0 --port 1337  
$ cuckoo api -H 0.0.0.0 -p 1337
```

To allow only authenticated access to the API, the `api_token` in `cuckoo.conf` must be set to a secret value. In new Cuckoo installations, a random token is automatically generated for you. To access the API, you must send the `Authorization: Bearer <token>` header with all your requests using the token defined in the configuration. Note that if you want to access the API over an insecure network such as the Internet, you should run the API server behind `nginx` described in the next section and enable HTTPS.

### 1. 必需套件curl

```
[root@float float-virtual-machine]# sudo apt-get install curl  
正在讀取套件清單... 完成  
正在重建相依關係  
正在讀取狀態資料... 完成  
下列的額外套件將被安裝：  
libcurl4  
下列【新】套件將會被安裝：
```

### 2. 找到這個檔案，刪除`is_xhr`這個參數，才能成功使用api server的command

```
json.py  
~/virtualenvs/sandbox/lib/python2.7/site-packages/flask
```

```
if current_app.config['JSONIFY_PRETTYPRINT_REGULAR'] and not request.is_xhr:  
    indent = 2  
    separators = (' ', ', ', ': ')
```

```
if current_app.config['JSONIFY_PRETTYPRINT_REGULAR']:  
    indent = 2  
    separators = (' ', ', ', ': ')
```

## 撰寫 CUCKOO SANDBOX 腳本(參考用)

3. 使用cuckoo api開啟官方host:8090的api server:(與web server:8080不衝突)

### Starting the API server

In order to start the API server you can simply do:

```
$ cuckoo api
```

4. 每個vm用戶會有一組專屬的憑證，用於在api server中識別你的project，而不會與其他人的project搞混：

To allow only authenticated access to the API, the `api_token` in `cuckoo.conf` must be set to a secret value. In new Cuckoo installations, a random token is automatically generated for you. To access the API, you must send the `Authorization: Bearer <token>` header with all your requests using the token defined in the configuration. Note that if you want to access the API over an insecure network such as the Internet, you should run the API server behind `nginx` described in the next section and enable HTTPS.

# 撰寫 CUCKOO SANDBOX 腳本(參考用)

5. 使用 /tasks/create/file 來上傳病毒檔並分析，若上傳成功，你會獲得一個任務序號 (可於 web server ui 查看進度)

POST /tasks/create/file

Adds a file to the list of pending tasks to be processed and analyzed.

```
import requests

REST_URL = "http://localhost:8090/tasks/create/file"
SAMPLE_FILE = "/path/to/malwr.exe"
HEADERS = {"Authorization": "Bearer S4MPL3"}

with open(SAMPLE_FILE, "rb") as sample:
    files = {"file": ("temp_file_name", sample)}
    r = requests.post(REST_URL, headers=HEADERS, files=files)

# Add your code to error checking for r.status_code.

task_id = r.json()["task_id"]

# Add your code for error checking if task_id is None.
```

# 撰寫 CUCKOO SANDBOX 腳本(參考用)

6. 在分析完成後，你就可以使用剛剛獲得的task\_id，以指令的形式下載report

## /tasks/report

GET /tasks/report/ (int: id) / (str: format)

Returns the report associated with the specified task ID.

Example request.

```
curl -H "Authorization: Bearer S4MPL3" http://localhost:8090/tasks/report/1
```

Parameters:

- `id` (required) (int) - ID of the task to get the report for
- `format` (optional) - format of the report to retrieve [json/html/all/dropped/package\_files]. If none is specified the JSON report will be returned. `all` returns all the result files as tar.bz2, `dropped` the dropped files as tar.bz2, `package_files` files uploaded to host by analysis packages.

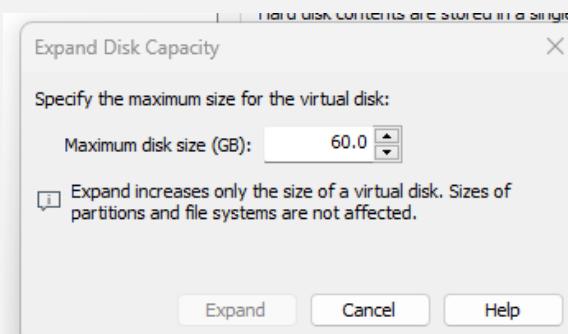

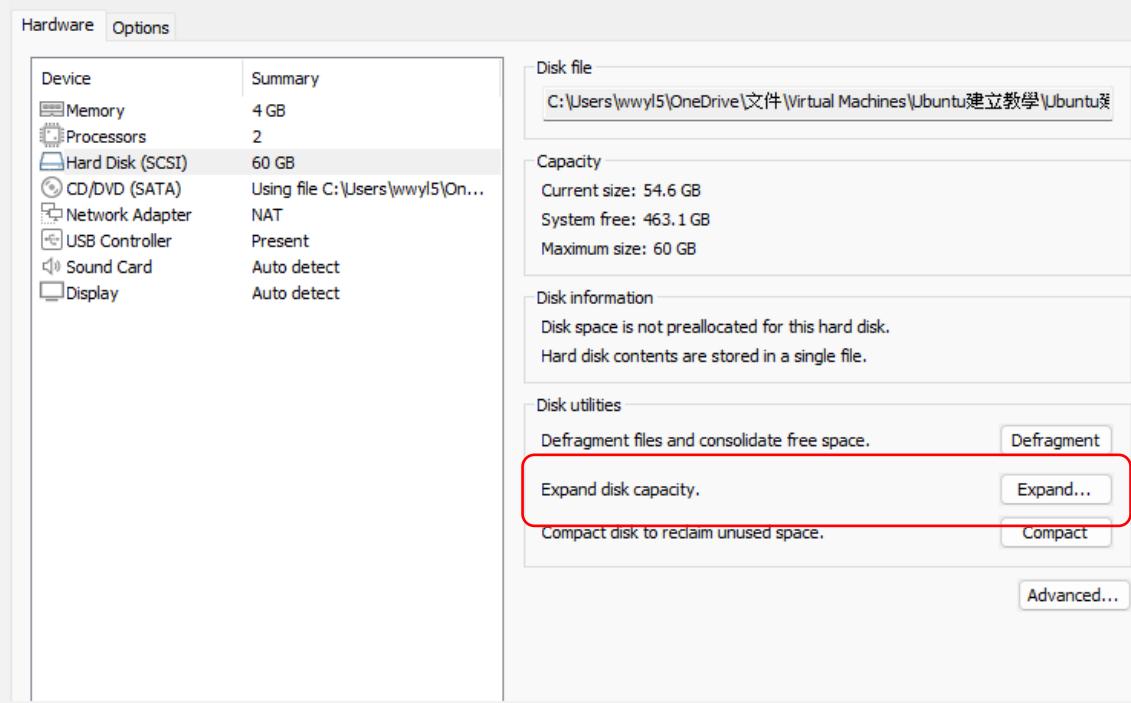

Status codes:

- `200` - no error
- `400` - invalid report format
- `404` - report not found

# 虛擬機硬碟空間擴充(參考用)

- 如果你發現你的容量耗盡，可以透過擴充空間來增加容量，但注意必須要關機才可以操作。

## 1. 點擊擴充，提高最大容量

## 2. 開啟”磁碟”：

## 3. 點齒輪選擇”調整大小”，把它拉滿才會應用在虛擬機裡：

# PYCHARM+ANACONDA安裝教學

(PYTHON 使用環境不限，這裡提供UBUNTU虛擬機的PYCHARM環境設置使用教學)

CS4003701

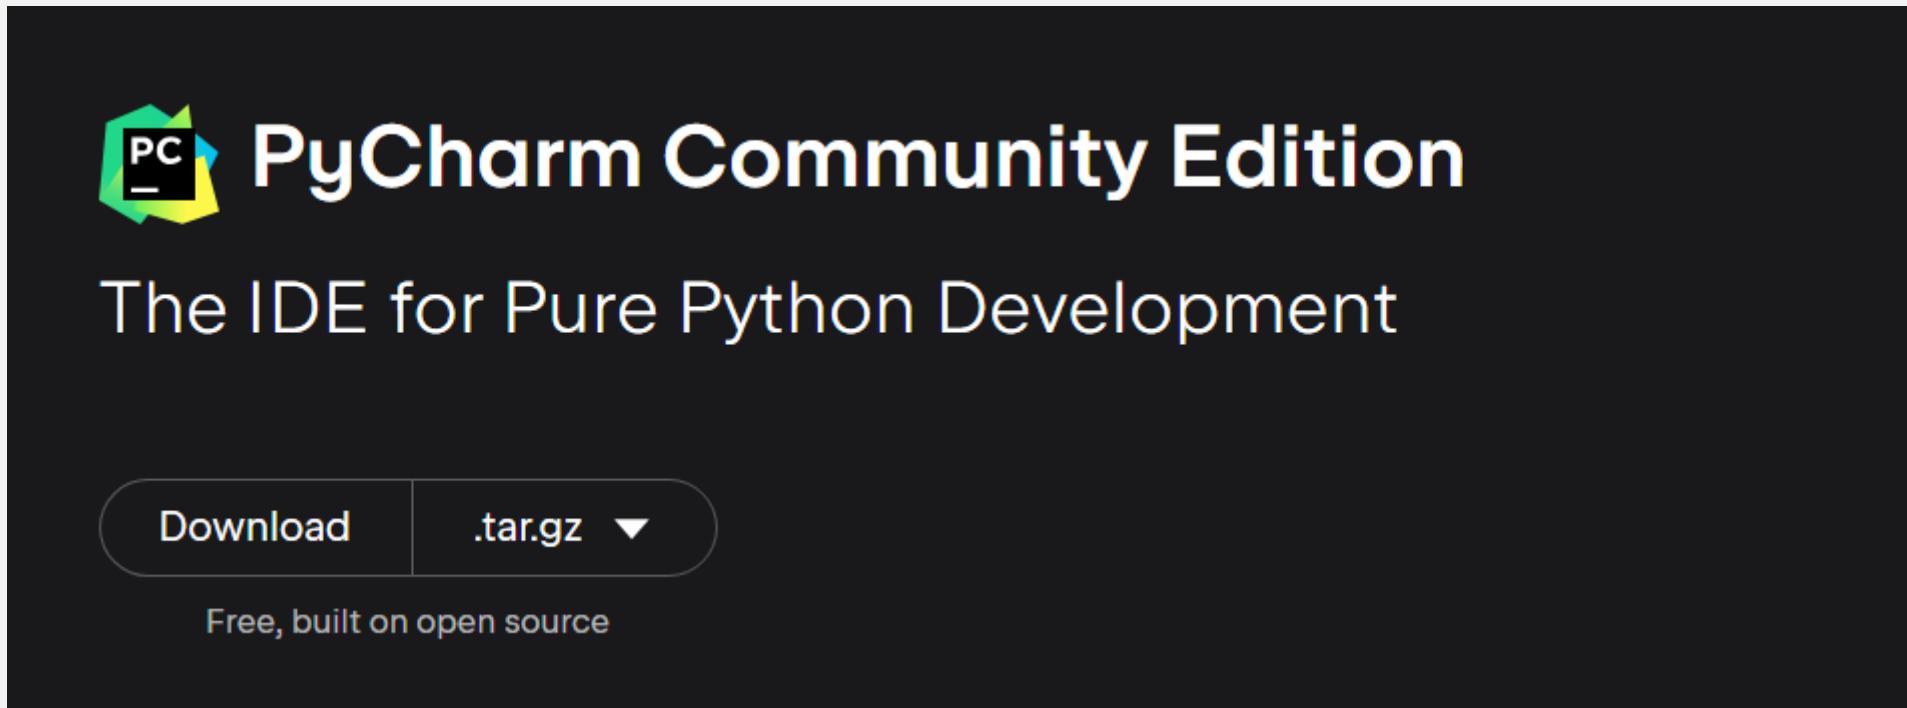

資訊安全導論

## 使用PYCHARM +ANACONDA

- 可以建立獨立的Python環境來使用，以避免不同套件的版本互相感擾
- 未來可建立不同環境來區分不同類型的作業
- Anaconda是建立環境與下載套件的工具
- Pycharm是開啟程式碼的GUI環境

# 安裝PYCHARM +ANACONDA

- <https://www.jetbrains.com/pycharm/download/?section=linux>  
記得要下載community版

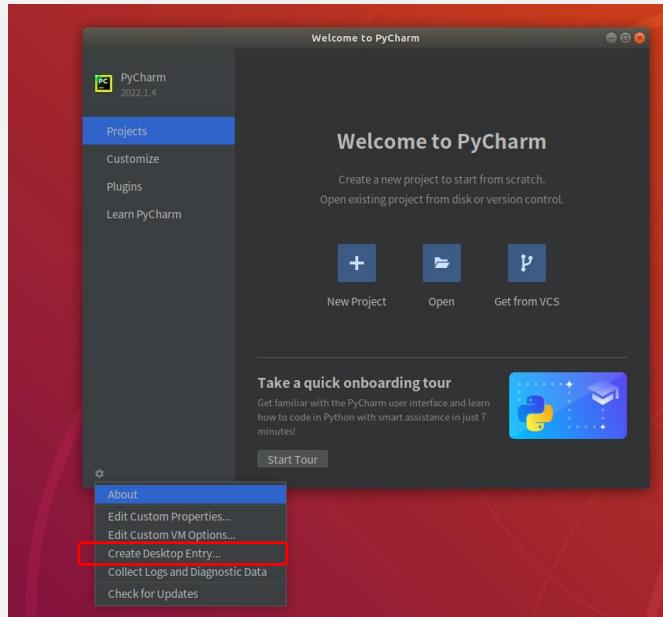

# 安裝PYCHARM + ANACONDA

## 1.解壓縮

```
float@float-virtual-machine:~$ cd 下載
float@float-virtual-machine:~/下載$ cd pycharm-community-2023.3.4
float@float-virtual-machine:~/下載/pycharm-community-2023.3.4$ cd bin
float@float-virtual-machine:~/下載/pycharm-community-2023.3.4/bin$ sh ./pycharm.sh
2024-03-05 00:16:13,033 [ 2397]  WARN - #c.i.o.a.i.ActionManagerImpl - keymap "Visual Studio" not found PluginDescriptor(name=IDEA CORE, id=com.intellij, descriptorPath=plugin.xml, path=~/下載/pycharm-community-2023.3.4/lib, version=221.6008.17, package=com.intellij.feedback, isBundled=true)
```

## 2.用終端機進入bin資料夾並執行

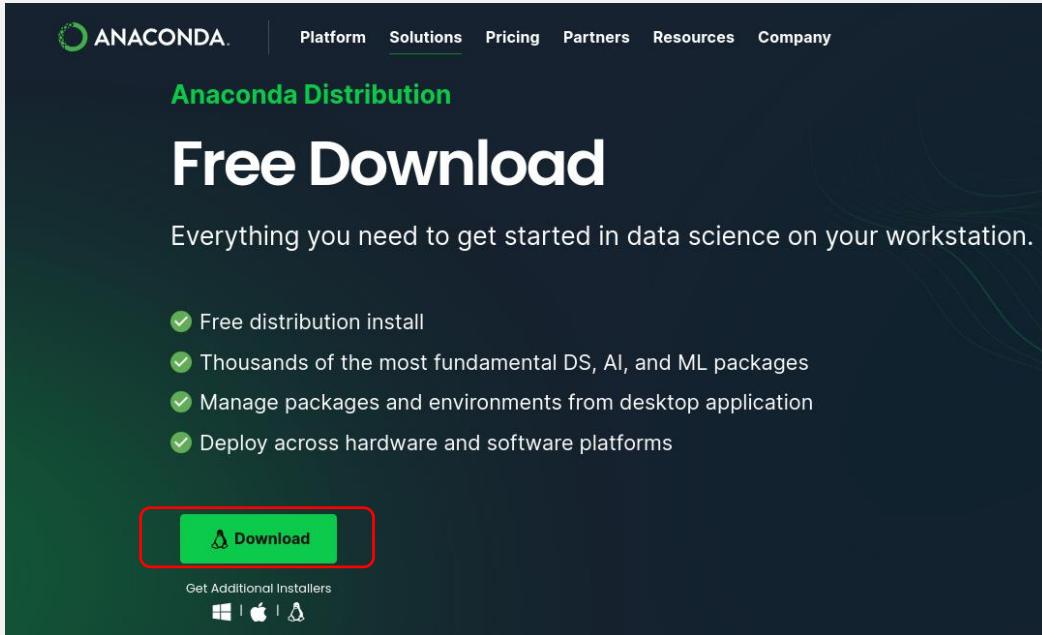

## 3.點左下角齒輪新增桌面捷徑

## 4.就可在本機軟體搜尋找到它

# 安裝PYCHARM + ANACONDA

- <https://www.anaconda.com/download/#linux>

1. 點選連結進去，點選Linux安裝包
2. 進到下載資料夾，執行腳本檔
3. 要按Enter然後慢慢把用戶協議看完
4. 最後要輸入yes同意，然後就確認安裝路徑

```
float@float-virtual-machine:~$ cd 下載
float@float-virtual-machine:~/下載$ bash Anaconda3-2024.02-1-Linux-x86_64.sh

Welcome to Anaconda3 2024.02-1

In order to continue the installation process, please review the license
agreement.
Please, press ENTER to continue
>>>
END USER LICENSE AGREEMENT
```

```
Please answer 'yes' or 'no':
>>> yes

Anaconda3 will now be installed into this location:
/home/float/anaconda3

- Press ENTER to confirm the location
- Press CTRL-C to abort the installation
- Or specify a different location below

[ /home/float/anaconda3 ] >>>
PREFIX=/home/float/anaconda3

Unpacking payload ...

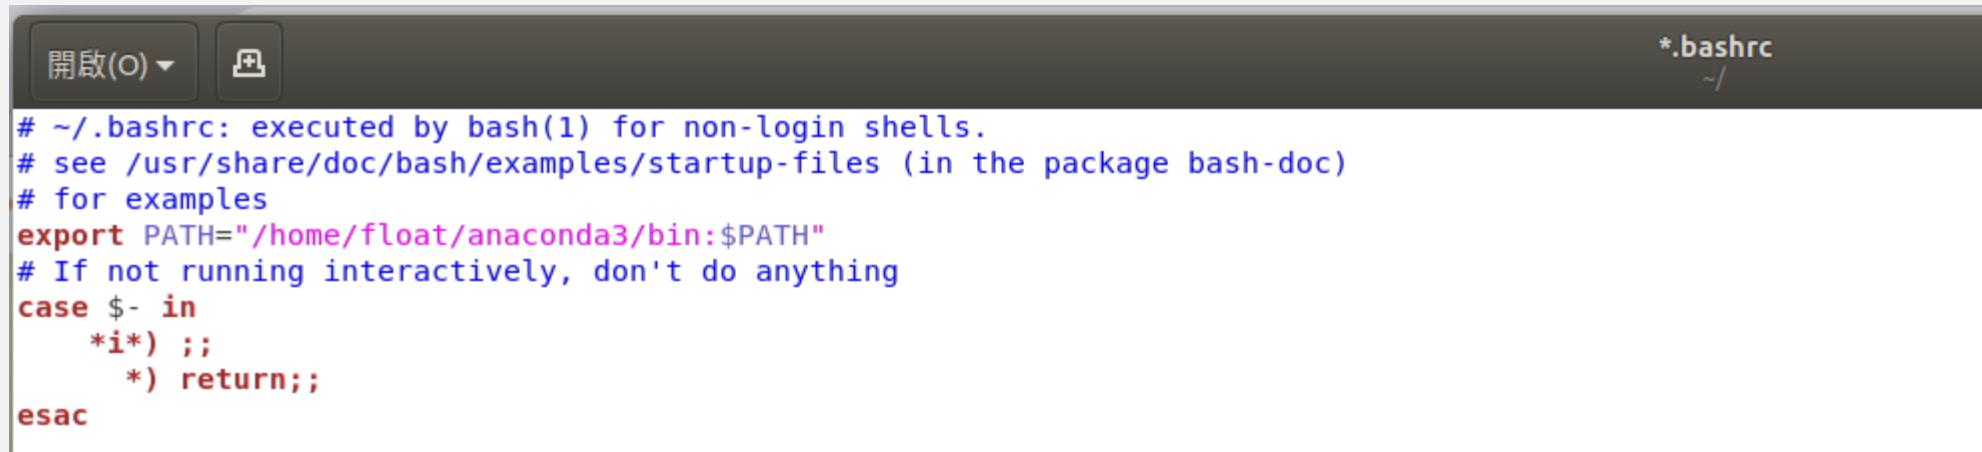

Installing base environment...
```

# 設定PYTHON環境變數

## I. 進入環境變數設定檔

```
float@float-virtual-machine:~$ sudo gedit ~/.bashrc
```

## 2. 在隨意地方新增export PATH="/home/username/anaconda3/bin:\$PATH"，並儲存

```
# ~/.bashrc: executed by bash(1) for non-login shells.
# see /usr/share/doc/bash/examples/startup-files (in the package bash-doc)
# for examples
export PATH="/home/float/anaconda3/bin:$PATH"
# If not running interactively, don't do anything
case $- in
  *i*) ;;
  *) return;;
esac
```

## 3. 讓環境變數生效

```
float@float-virtual-machine:~$ source ~/.bashrc
```

## 4. 檢查是否成功，成功會顯示下面的路徑

```
float@float-virtual-machine:~$ which python
/home/float/anaconda3/bin/python
```

## 建立測試環境

1. 建立一個名為test\_env，python直譯器版本為3.7的環境

```
float@float-virtual-machine:~$ conda create --name test_env python=3.7
```

2. 啟動環境

```
float@float-virtual-machine:~$ conda activate test_env
```

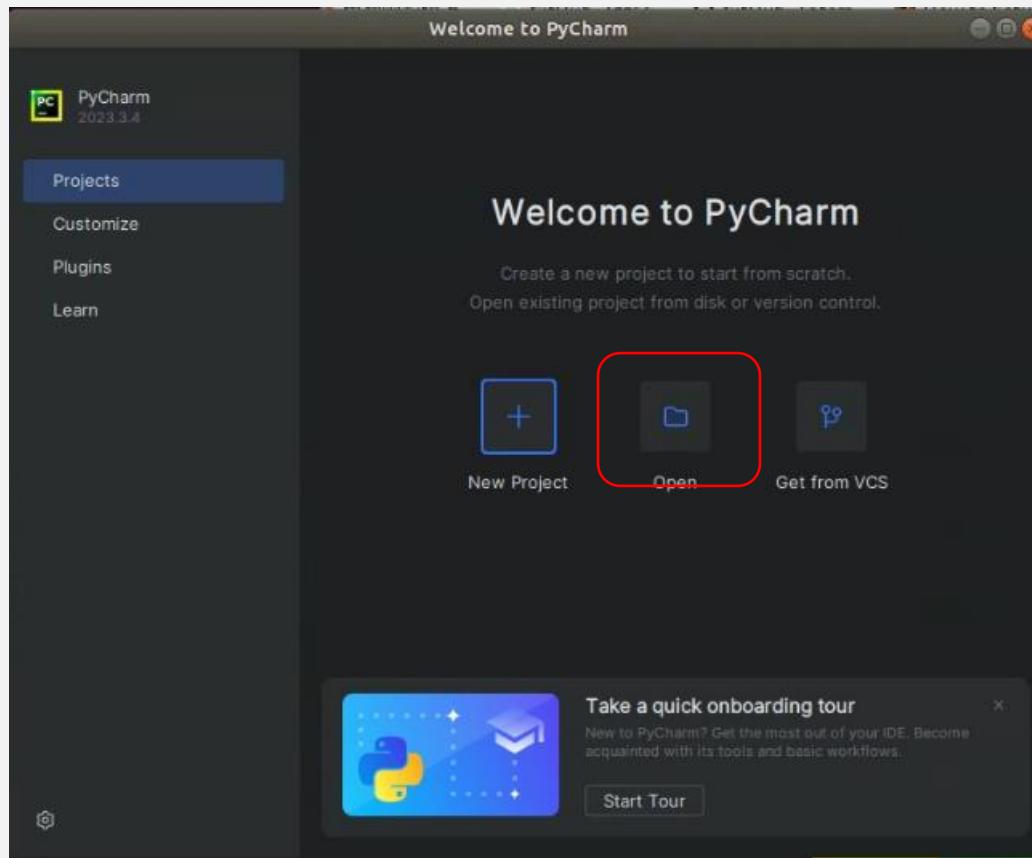

3. 使用 “conda install 套件名稱” or “pip install 套件名稱” 來下載執行所需套件庫

```
(test_env) float@float-virtual-machine:~$ pip install numpy
Collecting numpy
  Downloading numpy-1.21.6-cp37-cp37m-manylinux_2_12_x86_64.manylinux2010_x86_64
  .whl (15.7 MB)
    ━━━━━━━━━━━━━━━━ 15.7/15.7 MB 8.3 MB/s eta 0:00:00
Installing collected packages: numpy
Successfully installed numpy-1.21.6
(test_env) float@float-virtual-machine:~$
```

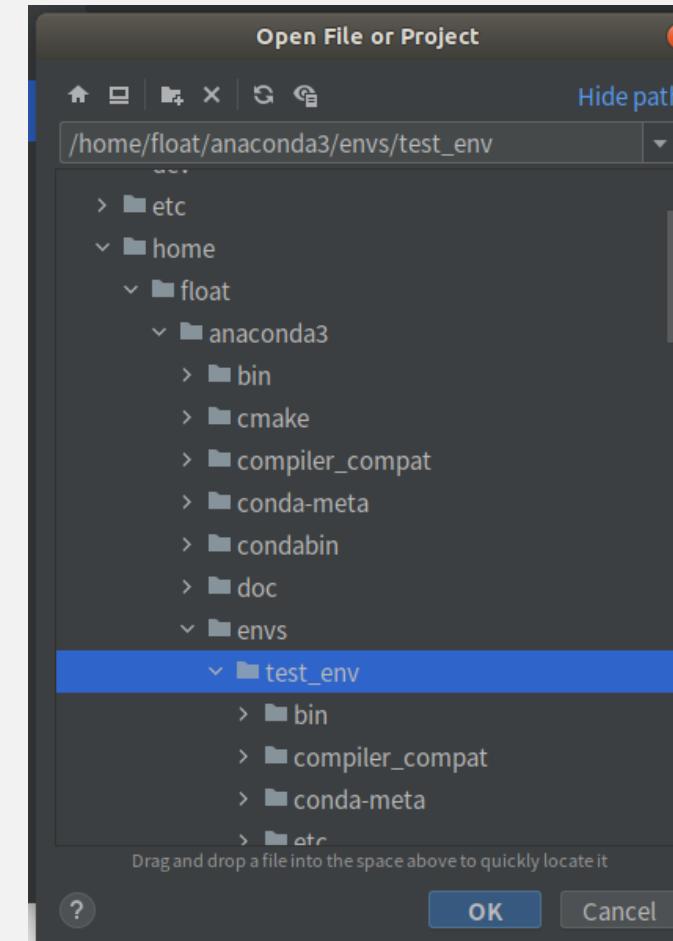

PS. 若出現”conda init before conda activate”的報錯，請再輸入一次”source ~/.bashrc”，讓環境變數重新生效，並關掉終端機再開一個。

# 建立測試環境

4. 下載好套件後，打開Pycharm，點選open。

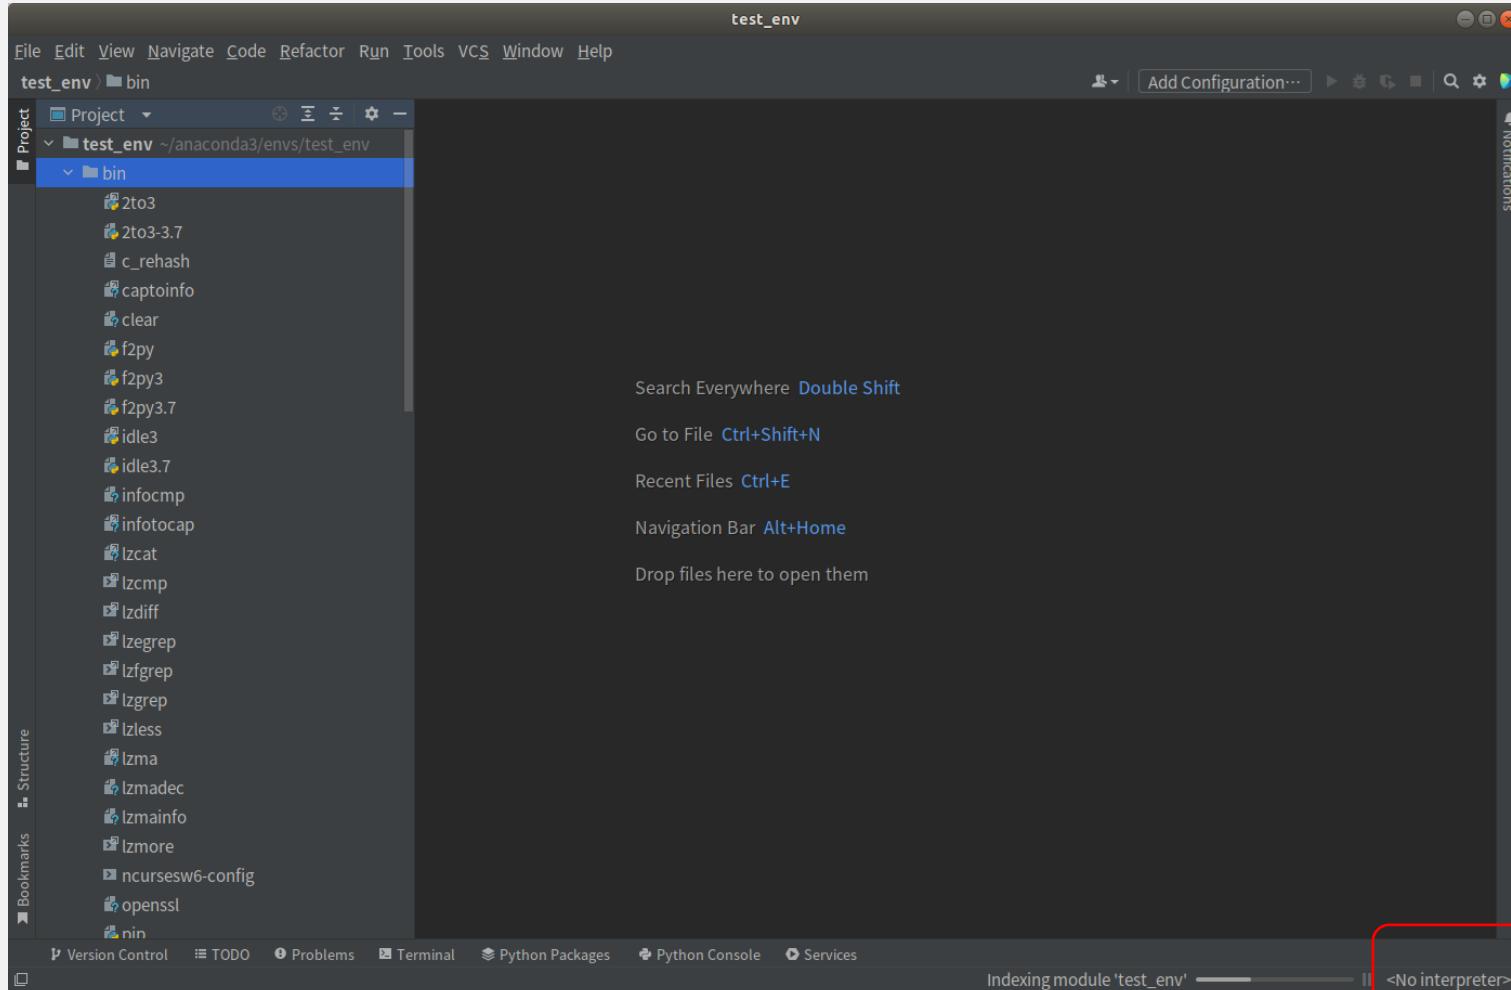

5. 找到envs資料夾，點選你想要開的環境的資料夾

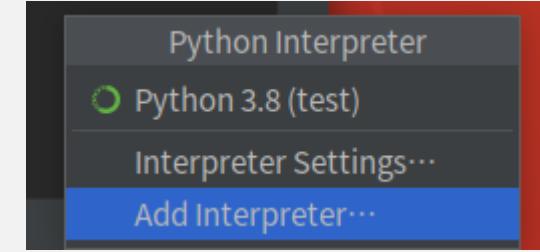

# 建立測試環境

## 6.點擊右下角設定直譯器

## 7.如果有你的環境檔名的直譯器可以直接點選就好

# 建立測試環境

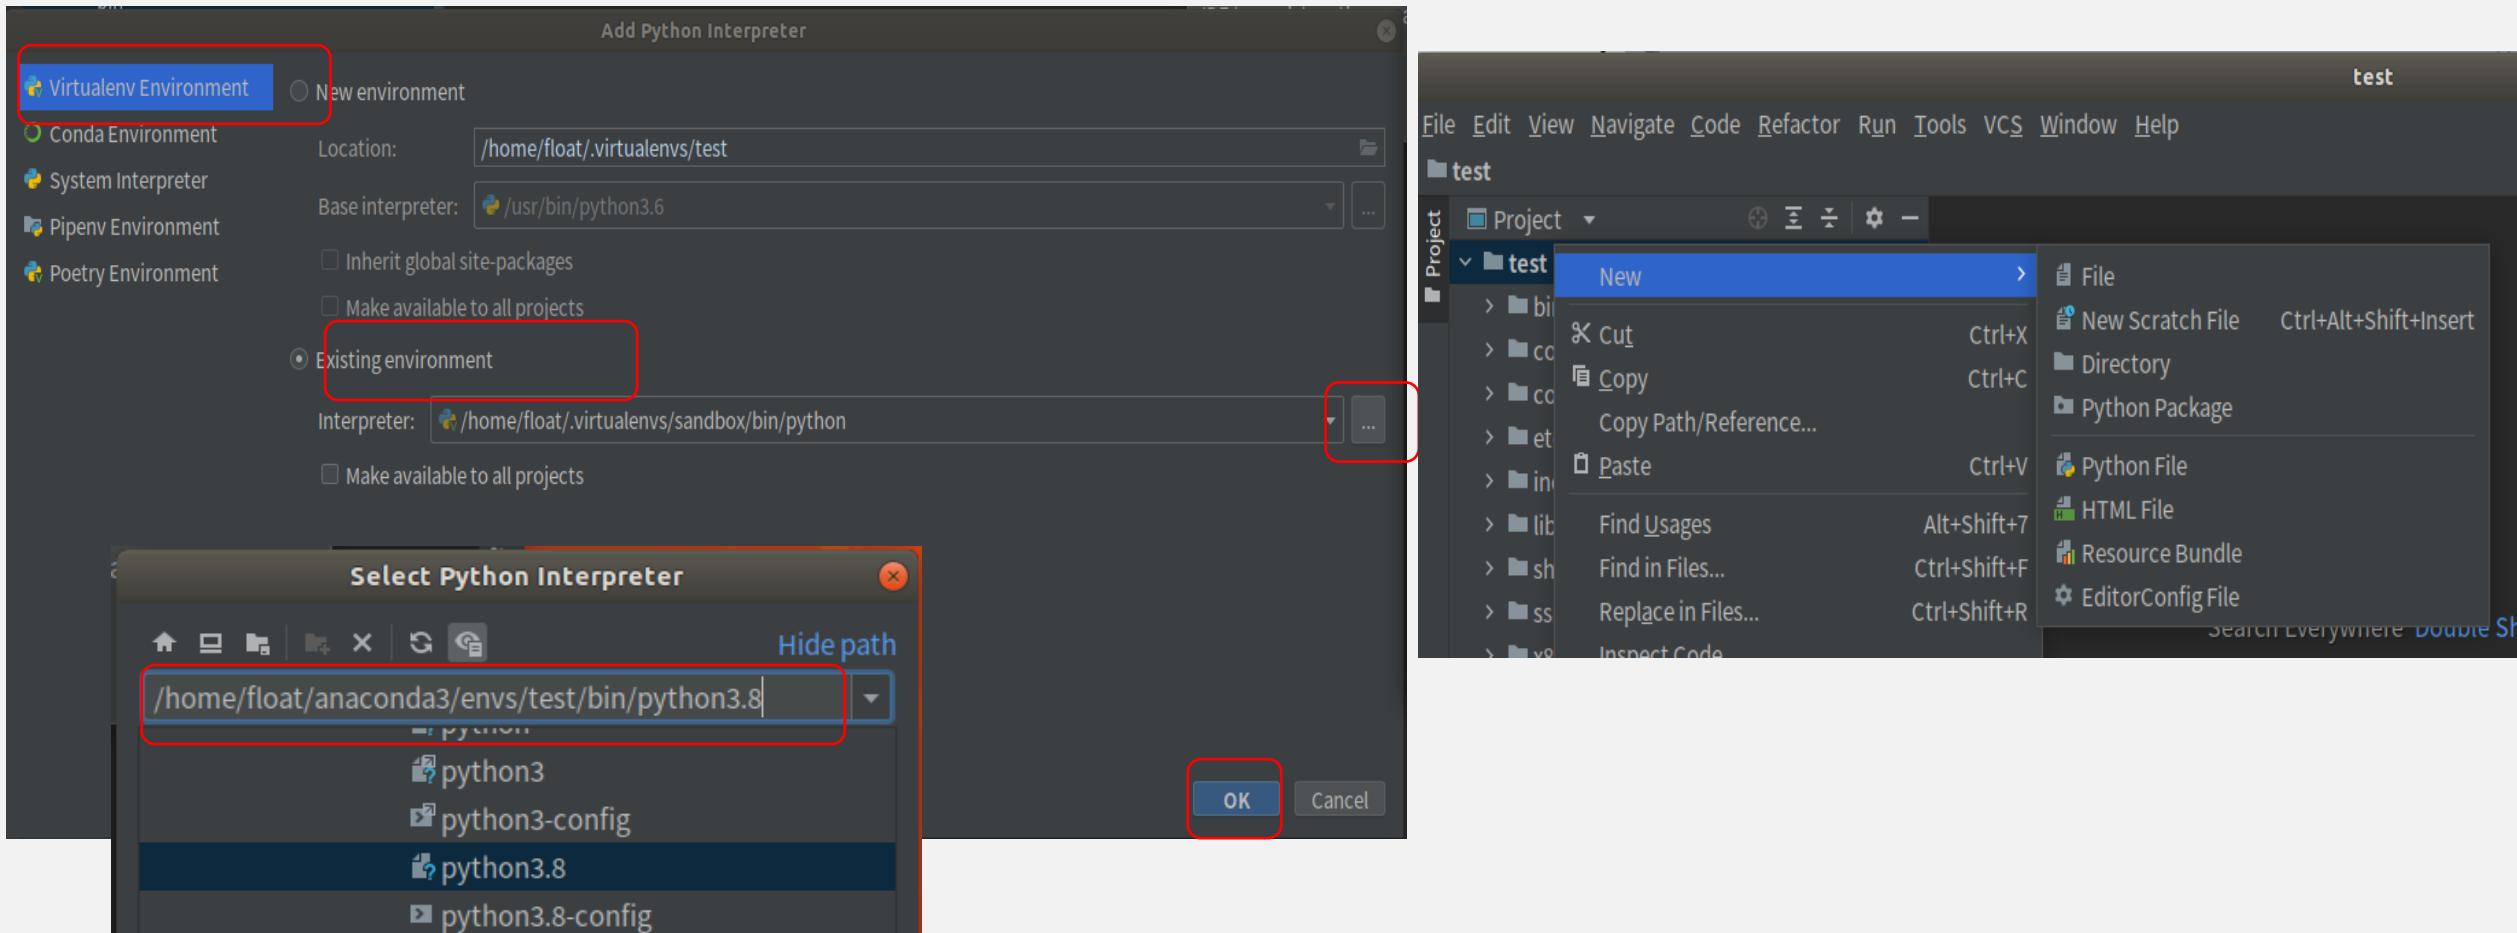

8.如果沒有，則點選Virtualenv Environment

9.點選Exist Enviroment

10.找到環境資料夾裡的python3.x檔案(有些版本在bin資料夾裡面，有些版本直接在環境資料夾裡面)

11.最後按ok啟動直譯器

12.啟動後就可以在左邊的檔案區，建立或複製python檔或其他檔案開始開發

## 建立測試環境

13.點擊Configuration，選擇Current file，即可按旁邊的綠色按鈕執行python檔案
